

ABSTRACT OF THE DISCLOSURE

A system for enabling a system down due to a lack of ability to be avoided and enabling a dynamic backup to be performed by properly allocating resources to a processing ability is provided. Each of a plurality of host systems connected through an information network is provided with a system status monitoring and change instructing mechanism which is physically independent of other component elements of the relevant host system, has a status management table of resources such as IPs, memory segments, and the like, and can enhance and reduce an ability of the host.
